

Multi-Agent Financial Risk Assessment & Scenario Simulation System

Scenario-driven financial risk modelling using AI agents

A System Designed for Dynamic “What-If” Exploration

Explore complex financial scenarios

Users can input plain-text “what-if” situations to test potential futures.

Recalculate risk metrics dynamically

The system adjusts all relevant metrics based on the specific scenario parameters.

Generate forward-looking insights

The output is not just data, but a scenario-specific forecast of potential risks and outcomes.

High-Level System Architecture

The Data Foundation: Historical Baseline for All Scenarios

The Scenario Manager: Translating User Intent into Action

The Main Agent interprets the scenario, asks only for essential inputs, and defaults all other values to the historical baseline data.

Sub-Agent Orchestration: Parallel Processing by Domain Experts

The Simulation Engine: Quantifying Uncertainty with Monte Carlo

Estimates the range of potential financial outcomes for each specific scenario.

The Dashboard: Visualising Scenario Impact

The Feedback Agent: Refining Prompts for Smarter Interactions

The agent observes user interactions and scenario outcomes to improve future prompt and parameter selection, increasing efficiency and relevance.

A Unified System for Scalable Risk Intelligence

Dynamic Intelligence

Converts static historical data into dynamic, forward-looking risk intelligence.

Modular Architecture

Employs an agent-based design that is flexible, scalable, and maintainable.

Explainable Insight

Delivers scenario-driven insights that are both powerful and transparent.
